

RESOURCE SERIES 01

AI Productivity Starter Kit

Less scramble. More stride.

Clearer messages. Better meetings. Work that moves.

A practical course for office workers who want useful AI assistance without losing control of the facts, the schedule, or the final decision. Twenty expanded prompt lessons, three worked cases, and a fillable planning workbook help you move from a promising first draft to work you can confidently use.

Expanded edition v2.0. Practical lessons, reusable prompts, and a fillable workbook for everyday office work.

START HERE

A course you can use today

Read a lesson. Try a task. Check the result.

Your route through the kit

Pages 3-8 build the method: a useful brief, controlled inputs, careful review, communication, scheduling, and evidence. Pages 9-28 develop all 20 prompts into individual lessons. Pages 29-31 walk through complete cases. Pages 32-34 contain your fillable planner, daily reset, and weekly review. Page 35 identifies the research used in this edition.

Your first 20 minutes

Choose a routine email you already understand. Spend five minutes writing the facts and desired action, five generating a draft, five checking every claim, and five revising it for the actual reader. This is a suggested practice session, not a promised completion time.

Make the material yours

Replace every bracketed field before running a prompt. The sample situations and outputs in this kit are invented teaching examples, not actual company correspondence or model performance guarantees. Start with one task you repeat often; keep the version that works and record what you changed.

Use the workbook

Fill the planner in a PDF reader that supports form fields, then save a separate copy for each week. If your viewer cannot save fields reliably, print the pages or copy the questions into your usual planner. Review is part of the work: an AI draft is useful only when its facts, meaning, and next steps survive your check.

THE WORKING METHOD

Give the task a destination

An effective prompt begins with an observable outcome.

Build the habit

A vague request produces a vague target. Before asking AI to help, decide what the reader should understand or do. An email that requests approval, a meeting record that assigns work, and a summary that supports a decision need different structures. State the deliverable in one sentence before supplying background. That sentence keeps the output connected to the work instead of drifting into general advice. Build a brief with five parts: task, audience, source facts, constraints, and output format. Add a sixth part when accuracy matters: the checks the answer must pass. For a supplier email, that might mean preserving an order number, marking an unconfirmed delivery date, and requesting a response without promising compensation.

Try this brief

Draft a 120-word supplier email requesting an updated delivery estimate. Use only the notes below. Separate confirmed facts from unknowns. Include a subject, the requested action, and questions for me outside the email. Do not promise a refund or a replacement.

When the first answer misses

Name the defect and change one instruction. Say "Keep the delivery date marked unconfirmed" rather than "make it better." If the input itself is missing a crucial fact, get that fact from the responsible person. Repeated prompting cannot create evidence that was never supplied.
